

I.A.R.81 BoPi "Dive Bomber"

CZ Historie:

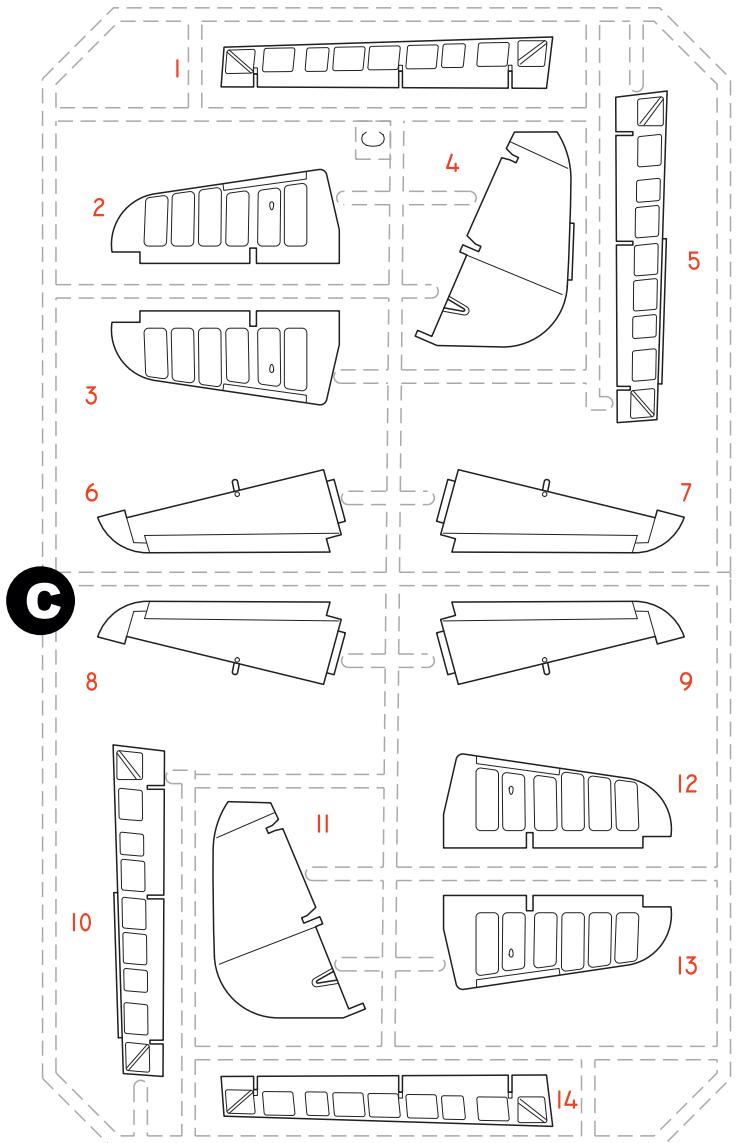

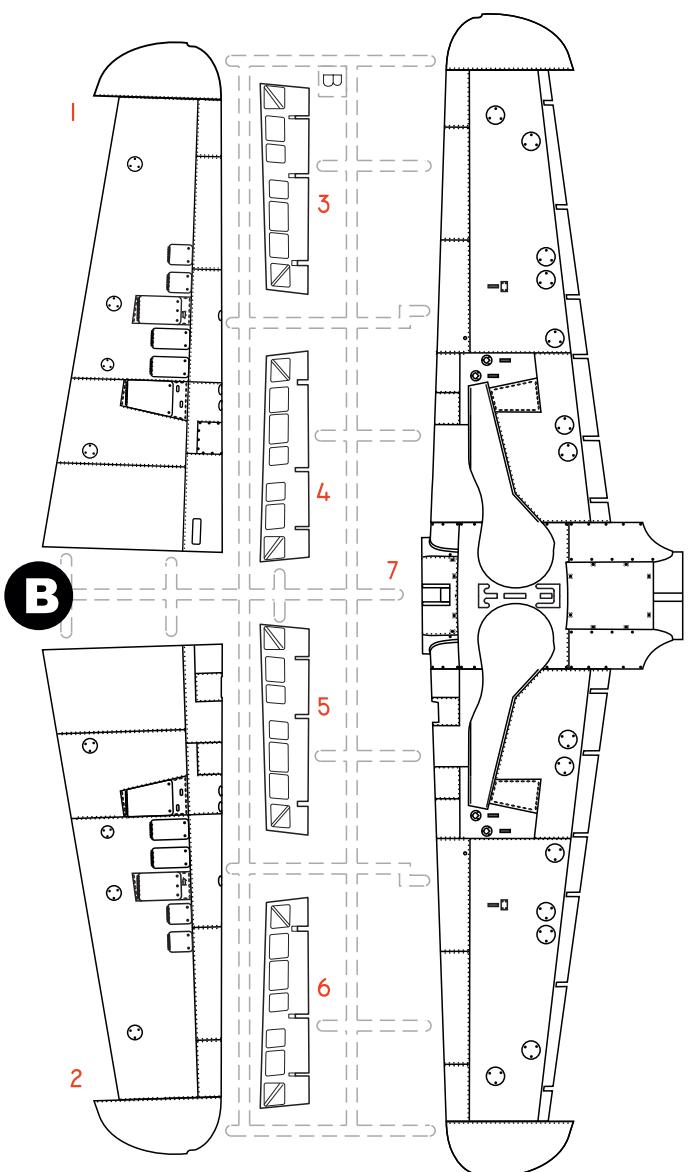

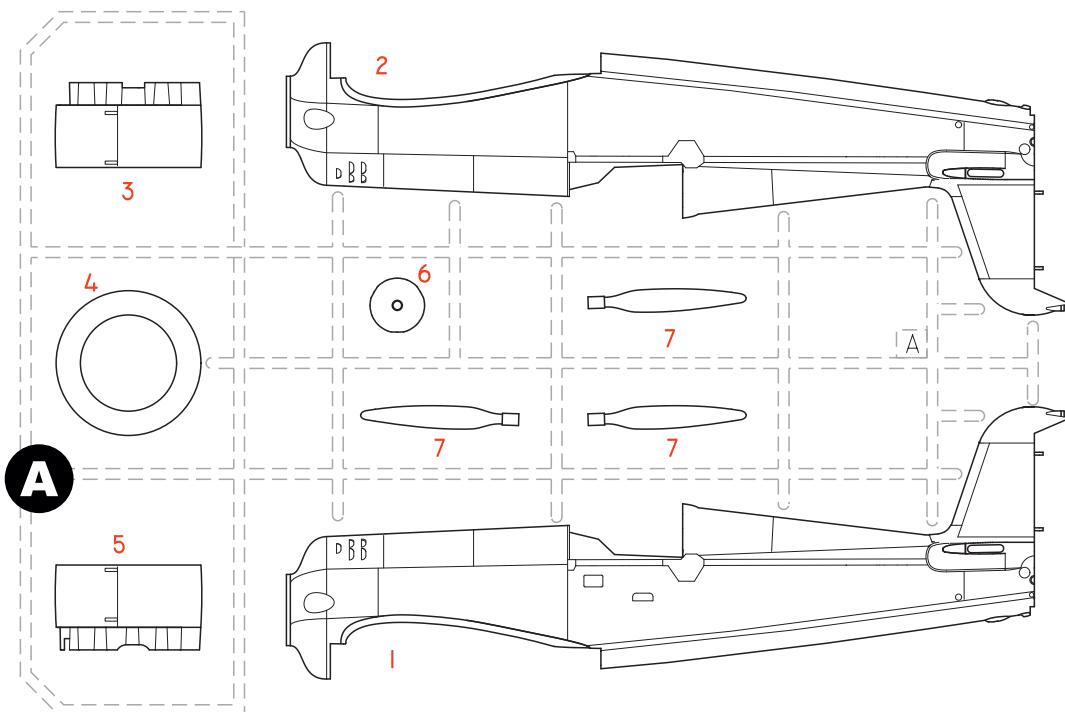

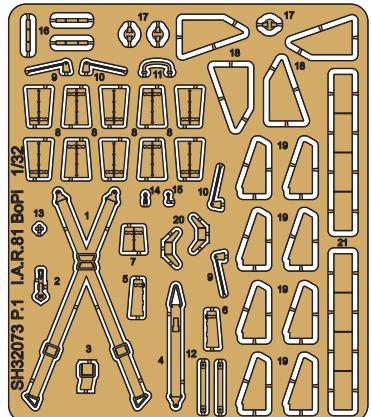

V druhé polovině třicátých let vyráběla rumunská letecká továrna I.A.R. v licenci polské celokovové hornoplošné stíhačky PZL.11 a PZL.24. Protože bylo jasné, že hornoplošná koncepce stíhacích letounů zastarává a budoucnost moderních stíhacích letadel patří dolnoplošným stíhačkám se zatahovacím podvozkem a krytou kabínou, byl vytvořen konstrukční tým, který měl zkonztruovat takovou stíhačku. Pod vedením Iona Grosu byl za použití výrobní technologie PZL.24 zkonztruován nový stíhací letoun, označený I.A.R.80. Původně uvažovaný německý motor Jumo nebyl použit. První prototyp, který vzlétl 4. dubna 1939, byl poháněn čtrnáctiválcovým dvouhvězdicovým motorem I.A.R. 14K-IIc32 o výkonu 870 hp. Nový stíhač dosahoval podobných výkonů jako jiné moderní stíhačky té doby jako Hurricane, P-36, MS 406 a Bf 109D. Sériově byly produkovány různé verze, lišící se hlavně výzbrojí, od I.A.R.80A přes I.A.R. 80C až ke stíhací-bombardovací verzi I.A.R.81C, navrženou na jaře 1941. Pro bitevní akce a hlavně střemhlavé bombardování byla určena verze I.A.R.81 BoPi. Ta byla vybavena výklopným závěsníkem pod trupem. Závěsník, podobně jako u německých Stuk umožňoval odhodit pumu ve střemhlavém letu tak, aby nezničila vrtuli. I.A.R.81 BoPi byl vyroben ve dvou sériích výrobních čísel 91-105 a 151-175. I.A.R.81C se stal nejpočetnější produkovanou subverzí (výr. čísla 300-450), vyráběl se od začátku roku 1943. Celkem bylo vyrobeno všech verzí I.A.R.80/81 patrně 450 ks. Výroba byla definitivně zastavena americkým náletem na továrnu I.A.R. v Brašově (stejně jako výroba Bf 109, která se tam právě rozbíhala). I.A.R.80/81 tvořily výzbroj stíhacích a bitevních jednotek rumunské armády od zapojení Rumunska do druhé světové války až do jejího konce. Prvních padesát kusů I.A.R.80 bylo zařazeno u bojových jednotek v době útoku na Sovětský svaz 22. června 1941. I.A.R.80/81 6. skupiny (61. a 62. letka) a 8. skupiny (41. a 60. letka) bojovaly v oblasti Stalingradu během podzimu 1942. 1. srpna 1943 prošly stíhačky I.A.R.80/81 při obraně ropných polí v Ploješti prvním těžkým bojem s B-24 Liberator USAAAF (operace Tidal Wave) a některé Liberatory sestřelily. 10. června 1944 prošly úspěšně soubojem s P-38 Lightning 82. a 1. FG. (Američtí piloti chyběně identifikovali I.A.R.80/81 jako Fw 190A). 24. srpna 1944 přešlo Rumunsko na stranu spojenců a nasadilo své I.A.R.80/81 s kokardami, pod vrchním sovětským velením, do bojů v Maďarsku. Posledními boji, úspěchy i ztrátami prošly I.A.R.80/81 nad Slovenskem a Moravou při osvobození Československa. V Rumunsku zbylé I.A.R.80/81 složily do padesátych let. Ještě v roce 1950 byly některé přestavěny na dvoumístné pokračovací cvičné letouny označované I.A.R.81DC.

Rozpětí: 10,52 m, délka: 8,97 m, plocha křídla: 16,00 m². Operační dostup 10 000 m, maximální rychlosť při 5 000 m: 485 km/h. Zbraně: 6x kulomet FN-Browning ráže 7,92 mm. Pod křídlo mohly být zavěšeny přídavné palivové nádrže nebo bomby, pod trupem na speciální závěsník byla zavěšována bomba 250 kg.

EN History:

In the late 1930s, the Polish PZL P.11 and P.24 all-metal, high wing fighter planes were produced under licence by I.A.R., Industria Aeronautica Romana. As it was quite clear that such type of design was nearing obsolescence and the future belongs to low wing fighters with retractable undercarriage and enclosed canopy, a design team led by Ion Grosu was formed with the aim to project a modern warplane of such sort. Using the P.24's fuselage structure, a new fighter plane was created and named the I.A.R.80. Originally, it was to be powered by a German Jumo engine, but as this power unit was never delivered, the first prototype airframe was fitted with the I.A.R. 14K-IIc32 fourteen-cylinder, double-row radial, delivering 870 hp and was taken aloft for the first time on April 9, 1939. The new fighter had performance approaching that of contemporary foreign designs like the Hurricane, P-36, MS 406 and Bf 109D. Various changes to weapons led to the I.A.R.80A, B and C sub-versions, and also the I.A.R.81C which was designed for fighter-bomber role during spring of 1941, although it served in both air interceptor and ground attack roles. Various versions of the I.A.R.80-81 were in the production, differing mainly by the type of armament, starting with the I.A.R.80A and through the I.A.R.80C to the final, fighter-bomber version I.A.R.81C which development began in the spring of 1941. For the ground attack and primarily for the dive bomber role, a special version was also designed called the I.A.R.81 BoPi, which was fitted with an underbelly bomb displacement gear, similar to that seen on the infamous Stuka aircraft. This type of bomb rack enabled the pilot to release the bomb during the dive and avoid the otherwise inevitable destruction of the propeller. The I.A.R.81 BoPi were produced in two blocks, with construction numbers 91-105 and 151-175. The I.A.R.81C was the most numerous sub-version to be produced (from no 300 to 450), deliveries starting early in 1943. Total production for I.A.R.80/81 series totalled around 450 units, but ceased (as well as the production of the Bf 109 type that only had just begun) after the American bombing of Brasov factory, on April 16th, 1944. The Romania Air Force's fighter and ground attack units were equipped with the I.A.R.80/81 type right from the beginning of the country's involvement in the Second World War and until the end of hostilities. Fifty I.A.R.80s were in service during the attack against the Soviet Union on June 22nd, 1941. 6th Group (61st and 62nd squadrons) and 8th Group (41st and 60th Squadrons) were engaged Stalingrad front during the autumn of 1942. August 1st, 1943 saw I.A.R.80 & 81s defending the Ploiești oil plants from attack by USAAF B-24 Liberators, during "Operation Tidal Wave", when the Rumanian fighters downed some of the heavy bombers. On June 10th, 1944, I.A.R.81Cs from 6th Fighter Group confronted P-38 Lightnings belonging to the USAAF 82nd and 1st FG (American pilots mistakenly reported having fought Fw 190s). Rumania joined the Allied powers in August 1944, and changed back the national insignia worn by its aircraft from crosses to traditional blue, yellow and red roundels. Being under Soviet command, the I.A.R.80/81 units saw combat over Hungary and later also during the liberation of Czechoslovakia over the areas of Moravia and Slovakia, where they enjoyed and suffered their final victories and losses. Remaining airframes of the 80/81 type kept on serving in Romania until the 1950s, some of them also being rebuilt in 1950 to advanced trainer version known as the I.A.R.81DC.

Wingspan: 10.52 m, length: 8.97 m, wing area: 16.00 m². Operational ceiling 10,000 m, maximum speed at 5,000 m: 485 Km/h. Weapons: 6x 7.92 mm FN-Browning machine guns. Two droppable fuel tanks could be carried on racks under the wings in place of bombs, plus a 250 kg bomb on a central fuselage rack.

Při lepení motorového krytu nejprve nasadte na motor díly A3 a A5 a k nim přilepte díl A4. Samostatně slepený motorový kryt nelze na motor nasadit.

Dry fit parts A3 and A5 around the engine and only then glue them together with part A4. Assembled cowling sits tightly around the engine and cannot be removed.

CAM. B

I.A.R.81 BoPi, No 101, Escadrila 45 Vanatoare BoPi, základna Urleasca, srpen 1944. Na začátku srpna 1944 tento letoun pilotoval při náletech na sovětská vojska útočící na opevněnou linii Focșani pilot Adj.Sef.Av Vasile Mirila. Paradoxem je, že na konci srpna 1944 byl vojskům Rudé armády umožněn touto linií průchod a Rumunsko přešlo na stranu spojenců.

CAM. C

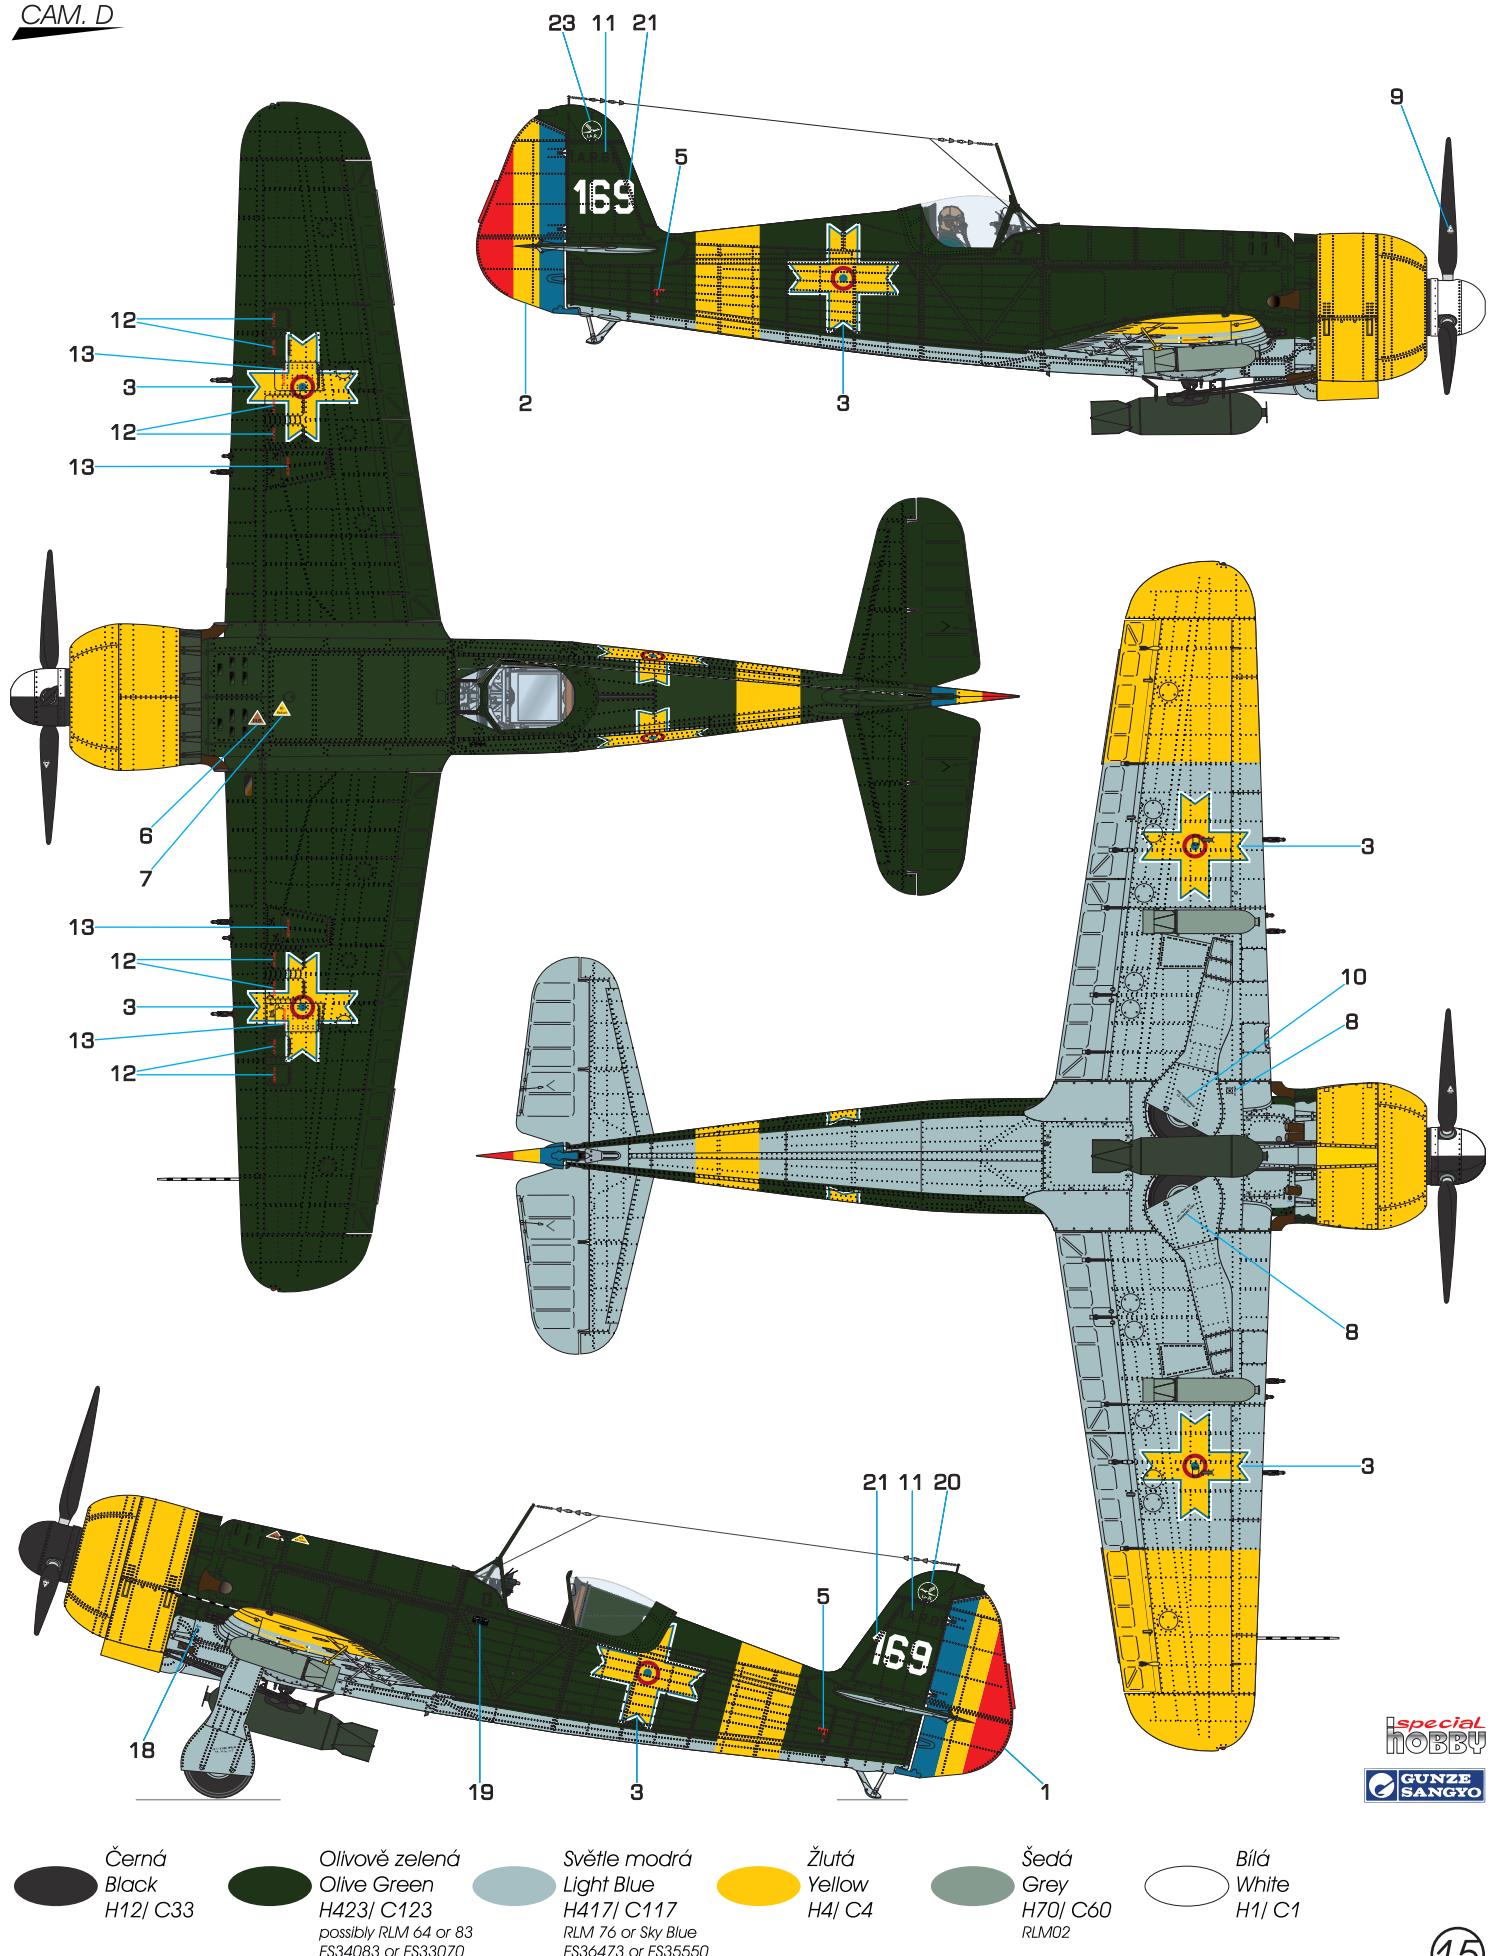

I.A.R.81 BoPi, operated by No 101, Escadrila 45 Vanatoare BoPi, based at Urleasca, August 1944. In the early days of August 1944, Adj.Sef.Av Vasile Mirila flew at the controls of No. 101 engaging Red Army forces attacking the fortified Focșani line. The paradox is, however, that at the end of the month, the Red Army was granted free passage through the fortified line and Romania switched sides and joined the Allies.

I.A.R.81 BoPi, No 169, Escadrila 61 Vanatoare BoPi, Grupul 6 Vanatoare, Flotila 2 Vanatoare, základna Targsor, 1942.
